EXP 1

Create numeric, character, and logical vectors and display type and content.

AIM:

To create numeric, character, and logical vectors and display type and content.

PROCEDURE:

Step 1: Open RStudio or R console on your system.
Step 2: Create a numeric vector containing numerical values.
Step 3: Display the contents of the numeric vector on the screen.
Step 4: Use the class function to check and print the data type of the numeric vector.
Step 5: Create a character vector containing names or text values.
Step 6: Display the contents of the character vector.
Step 7: Use the class function to identify and print the data type of the character vector.
Step 8: Create a logical vector containing TRUE and FALSE values.
Step 9: Display the logical vector on the screen.
Step 10: Use the class function to print the data type of the logical vector.
Step 11: Observe and note that numeric, character, and logical vectors each have distinct data types.

CODE:

```
numeric_vector <- c(10, 20, 30, 40, 50)
cat("Numeric Vector:\n")
print(numeric_vector)
cat("Data Type:", class(numeric_vector), "\n\n")
character_vector <- c("Apple", "Mango", "Orange", "Banana")
cat("Character Vector:\n")
print(character_vector)
cat("Data Type:", class(character_vector), "\n\n")
logical_vector <- c(TRUE, FALSE, TRUE, FALSE)
cat("Logical Vector:\n")
print(logical_vector)
cat("Data Type:", class(logical_vector), "\n")
```

OUTPUY:

```
Numeric Vector:
[1] 10 20 30 40 50
Data Type: numeric

Character Vector:
[1] "Apple"  "Mango"  "Orange" "Banana"
Data Type: character

Logical Vector:
[1]  TRUE FALSE  TRUE FALSE
Data Type: logical
```
